

Computer Programming

Computer programming ranges from micro-processor programming to advance Windows applications such as Crystal Reports. Industry today will have equipment and systems with several different languages. It is impossible to keep an IT staff that can address all of them, that's the time to call Willis Consulting.

Real Life Project: Obsolete Software

A manufacturing company has a piece of equipment running an obsolete software application and began to experience problems. The downtime cost the company thousands of dollars a day so there was no time to upgrade the equipment. No one at the company understood the proprietary programming language.

Solution: Call Willis Consulting of York

Willis Consulting began with the manual and de-ciphered the program. As it turned out, it was a memory problem on the computer. After the computer was repaired, some programming changes make life easier until upgraded equipment could be purchased and installed. The upgraded equipment utilizing National Instruments and programmed with LabView proved to be the most cost efficient solution and a technician was trained on simple programming changes that could be completed in the future.

- C++ Applications
- Visual Basic
