

Everyone knows Internet is a powerful tool to connect you to your customers, branch offices, field employees and other associated companies. But Internet technologies can also provide a powerful tool in the workplace as an Intranet to handle ISO 9000 requirements, applications, and human resources.

XML is a powerful database tool that can translate between incompatible databases.

Real Project: Visitor Sign-In

A York business receives many visitors a day from customers, vendors and contractors. Each visit requires the typical sign-in: name, company, time-in etc. Follow-up is important especially to customers, so each day, the receptionist types the information into a spreadsheet. There is also a company safety and confidentiality sheet that needs to be reviewed once a year. The whole system is an inconvenience to both the company and frequent visitors.

Solution: Call Willis Consulting of York

Willis Consulting designed a data driven Intranet application to sign-in visitors. Using a touch-screen monitor, frequent visitors can quickly find their name and automatically sign-in. New visitor sign-in takes less time and all the information is already stored for follow-up calls. The safety and confidentiality sheet is online and the system tracks visitor acknowledgment. The database can be viewed by any employee and searches can be made based on name or company. The whole system presents a more professional experience for everyone.
